Q1. Find Customer Referee SQL Solved

Using hints except Complete Solution is Penalty free now Use Hint

Write an SQL query to fetch the **names** of the customer that are **not referred** by the customer with **id = 102**.

Table: customer

Column Name	Type
id	int
name	varchar
referee_id	int

Sample Input:

id	name	referee_id
100	Genovera	133
101	Melodie	101
102	Teddie	195
103	Gwenneth	102
104	Karolina	191
105	Pearline	159
106	Daryl	102

MySQL (MySQL 5.6)

```
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM EMPLOYEE;
*/
select name
from customer
where referee_id <> 102;
```

Q2. Find Customers With Positive Revenue this Year SQL Solved

Using hints except Complete Solution is Penalty free now Use Hint

Write an SQL query to report the **unique customers** with **postive revenue** in the **year 2021**.
Note: Use distinct operator to get unique values.

Table: Customers

Column Name	Type
customer_id	int
year	int
revenue	int

Sample Input:

customer_id	year	revenue
108	2021	-1
106	2019	15
102	2019	-2
100	2021	4

Sample Output:

customer_id
100

MySQL (MySQL 5.6)

```
select distinct customer_id
from customers
where year = '2021' and revenue >0;
```

Q3. New Salary SQL Solved

Using hints except Complete Solution is Penalty free now Use Hint

Context:
Zenith Tech Solutions is a growing software development company. The company is reviewing employee compensation and considering salary increases as a way to reward employee performance and stay competitive in the job market, Zenith Tech is considering a salary increase for all staff. To calculate the potential impact of a salary increase, Zenith Tech wants to analyze the effects of a 20% raise for all employees. By analyzing the "**New_salary**" column, Zenith Tech can assess the overall financial implications of a company-wide raise and make an informed decision about salary adjustments. This can help them retain valuable talent and attract top performers in the competitive tech industry.

Problem Description:
Write a SQL query to create a new column named "**New_salary**" within their "employees" table. This column will reflect the adjusted salary after applying a **20% raise** to the current salary ("salary").

Steps to calculate the salary increment:

1. Multiply the current salary by the percentage of the increment.
2. Divide the result by 100.
3. Then add the result to the current salary.
4. Name the column as 'New_Salary'
5. Round off the 'New_salary'. Use Round() for this.

Result:
Return the columns emp_id, name, salary, and 'New_salary'.
Order the output by the emp_id in ascending order.

Table: employees

Column Name	Type
emp_id	int
name	varchar

MySQL (MySQL 8.0)

```
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM employees;
*/

select emp_id, name , salary, round(salary+(salary*0.2)) as New_salary
from employees;
```

Q4. Total Amount SQL Solved

Using hints except Complete Solution is Penalty free now Use Hint

Problem Description:
Write a query to calculate the `sub_total` for each order line and return the columns **orderNumber**, **productCode**, and **sub_total**.

Table: orderdetails

Column Name	Type
orderNumber	int
productCode	varchar
quantityOrdered	int
priceEach	float
orderLineNumber	int

Note:

- To get the **sub_total** for each **orderNumber**, it is calculated by **multiply** the **quantityOrdered** column by the **PriceEach** column.
- Round off the **sub_total** up to **two** decimal places.
- Order the results by **orderNumber** in ascending order and **sub_total** in descending order.

Sample Input:
Table: orderdetails

orderNumber	productCode	quantityOrdered	priceEach	orderLineNumber
10100	S18_1749	30	136.00	3
10100	S18_2248	50	55.09	2
10100	S18_4409	22	75.46	4
10100	S24_3969	49	35.29	1

MySQL (MySQL 8.0)

```sql
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM orderdetails;
*/
select orderNumber,productCode,round(quantityOrdered'priceEach,2) as sub_total
from orderdetails
order by orderNumber asc ,sub_total desc;
```

Q5. Employee 101 SQL Solved

Using hints except Complete Solution is Penalty free now Use Hint

Context:
Unified Solutions Inc. is a technology consulting firm specialising in workforce management solutions, dedicated to providing tailored staffing solutions to optimise business operations. The company prides itself on deploying highly skilled professionals to meet the staffing needs of various industries. To maintain accurate records of employee career progression and ensure effective human resources management, Unified Solutions Inc. utilizes a comprehensive job history database.
You are a database administrator at Unified Solutions Inc. As part of your responsibility to manage employee records, you need to retrieve details from the job history for all employees except for the employee with ID 101. This data is crucial for tracking career trajectories, facilitating performance evaluations, and supporting strategic workforce planning initiatives.
Problem Statement:
Write a query to get all the details of all the employees from **job_history** except for the employee with ID **101.**
Result:

- Return all the fields.
- Return the result ordered by employee_id and job_id in ascending order.

Table: job_history

Column Name	Type
employee_id	INT
start_date	DATE
end_date	DATE
job_id	VARCHAR

MySQL (MySQL 8.0)

```sql
select * from job_history
where employee_id <> '101'
order by employee_id,job_id asc;
```

Q6. Not Boring Movies SQL Solved

Using hints except Complete Solution is Penalty free now Use Hint

Table: Cinema

Column Name	Type
id	int
movie	varchar
description	varchar
rating	int

- id is the primary key for this table.
- Each row contains information about the name of a movie, its genre, and its rating.
- rating is a 2 decimal places float in the range [0, 10]

Write an SQL query to report the movies with an **odd-numbered ID** and a **description that is not "boring".**
Return the result table ordered by rating in **descending order** and id in **ascending order**.

Note: Use the mod(column_name,number) function to find out an odd-numbered or even-numbered ID.

Example:
Table: Cinema

id	movie	description	rating
1	War	great 3D	8.9
2	Science	fiction	8.5
3	irish	boring	6.2

MySQL (MySQL 5.6)

```sql
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM EMPLOYEE;
*/
select * from Cinema
where description <> 'boring' and id%2 <> 0
order by rating desc,id asc;
```

Q7. Big Countries SQL Solved

Using hints except Complete Solution is Penalty free now — Use Hint

A country is big if:

- it has an **area** greater than **300000** km2, **AND**
- it has a **population** greater than **20000000**.

Write an SQL query to report the **name, population, and area** of the **big** countries.

Return the resultant table **ordered by population** in **ascending order**.

Table: world

Column Name	Type
name	varchar
continent	varchar
area	int
population	int
gdp	int

Sample Input:

Table: world

name	continent	area	population	gdp
Basse-Terre	Cote D"Ivoire	2098650	4993739	2147483647

MySQL (MySQL 5.6)

```
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM EMPLOYEE;
*/
select name,population,area from world
where area>300000 and population>20000000
order by population;
```

Q8. Invalid Tweets SQL Solved

Using hints except Complete Solution is Penalty free now — Use Hint

Write an SQL query to find the IDs of the invalid tweets. The tweet is **invalid** if the number of characters used in the content of the tweet is **strictly greater than 15**.

Return the resultant table **ordered by tweet_id in ascending order**.

Note: Use the length(column_name) function to find the length of the string.

Table: tweets

Column Name	Type
tweet_id	int
content	varchar

Sample Input:

Table: tweets

	tweet_id (INT)	content (VARCHAR)
1	100	This question is ver...
2	101	Hello!
3	102	Let's learn SQL prog...
4	103	Hello!
5	104	I love SQL
6	105	This question is ver...
7	106	Hey Welcome!

Sample Output:

tweet_id

MySQL (MySQL 5.6)

```
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM EMPLOYEE;
*/
select tweet_id
from tweets
where length(content) > 15;
```

Q9. Retrieve Customers with Specific Name SQL Solved

Using hints except Complete Solution is Penalty free now — Use Hint

Consider a database schema for customers with the following table:

Customers: customer_id (Integer, Primary Key) ,first_name (Text), last_name (Text), email (Text)

Write an SQL query to search for customers whose first name is "John" **or** last name is "Smith," and full name **is not** 'John Smith'.

Return the output ordered by customer_id in ascending order.

Sample Input:

Table: Customers

customer_id	first_name	last_name	email
1	John	Smith	john.smith@example.com
2	Jane	Doe	jane@example.com
3	Mary	Johnson	mary@example.net
4	John	Williams	john@example.com
5	Steve	Smith	steve@example.org

Sample Output:

customer_id	first_name	last_name	email
4	John	Williams	john@example.com
5	Steve	Smith	steve@example.org

MySQL (MySQL 5.6)

```
/* YOUR QUERY GOES HERE
   Example: SELECT * FROM EMPLOYEE;
*/
select * from Customers
where  (concat(first_name,' ', last_name) <> 'John Smith' and (first_name='John' or last_name='Smith'))
order by customer_id;
```

Q10. Filter Products in Electronics Category

SQL Solved

Using hints except Complete Solution is Penalty free now

Use Hint

Consider a database schema for products with the following table:
Products: product_id (Integer, Primary Key),product_name (Text),category (Text),price (Integer)
Write an SQL query to retrieve products that belong to the **"Electronics"** category and have a price **greater than 500** or products that belong to the **"Apparel"** category and have a price **less than 50**.

Return the output ordered by **product_id** in **ascending order**.

Sample Input:

Table: Products

product_id	product_name	category	price
1	Laptop	Electronics	800
2	SmartPhone	Electronics	500
3	T-Shirt	Apparel	20
4	Sneakers	Apparel	60
5	Coffee Maker	Appliances	120

Output:

product_id	product_name	category	price
1	Laptop	Electronics	800
3	T-Shirt	Apparel	20
